

JOSHUA ISRAEL MUTHU S

Senior Backend Engineer | Technical Lead

Chennai, India | +91 9003497291 | joshuamuthumsm@gmail.com | linkedin.com/in/joshua-s-5b9854109

Dear Hiring Manager,

I'm applying for Senior Backend Engineer / Technical Lead roles where I can bring hands-on backend engineering, cloud modernization, and data engineering experience to a team solving real scale and reliability challenges. Over 7+ years, I've built and modernized enterprise backend platforms across Financial Services, Healthcare, Airline Loyalty, and SaaS — and I'm drawn to opportunities that combine strong engineering fundamentals with ownership over architecture and outcomes, not just delivery.

In my current role at IBM Consulting, on an American Express engagement, I work across both platform modernization and data engineering. I led the migration of Java applications from JBoss to Apache Tomcat, and designed a custom Python automation script that drove the migration of roughly 400 repositories from Jenkins to GitHub Actions — removing manual conversion work and standardizing CI/CD practices across teams. Alongside this, I build and maintain Python-based Airflow pipelines that transform ads data and load it into BigQuery for downstream reporting and analytics, which has sharpened my data engineering skills alongside my core backend work.

Previously, as Technical Lead at GAVS Technologies, I designed backend microservices for a healthcare platform processing roughly 100,000 ANSI 835 claims per day, and improved API latency by 60% through Redis caching and PostgreSQL query optimization. I built cloud-native services on AWS ECS/EC2 using Java 17, Spring Boot, PostgreSQL, Redis, and Terraform. Across these roles, I've also led and mentored engineering teams of up to 10, run technical design reviews, and supported production systems end to end — so I'm as comfortable writing code as I am guiding a team through a hard technical decision.

I'm currently pursuing an M.Tech in AI & ML alongside IBM certifications in Generative & Agentic AI and Application Modernization with watsonx, reflecting where I want to keep growing: backend systems that increasingly intersect with data and AI-driven workflows.

I'd welcome the chance to bring this mix of backend depth, cloud modernization experience, and technical leadership to your team, and to discuss how it fits what you're building. Thank you for your time and consideration.

Sincerely,

Joshua Israel Muthu S
